## **Product Name and Version : Astronaut Version 1709**

### **INTRODUCTION**

In this documentation we will list all the steps required to access protected health information based on the documentation of an open API. The API makes health information broadly available using FHIR®, a set of clinical interoperability resources under the umbrella of the HL7 standards organization. FHIR is based on common web standards can be reached through a RESTful protocol in which each FHIR resource has a known URL. This document describes OAuth 2.0 for client applications to authorize, authenticate, and integrate with FHIR-based data systems.

We follow Smart-On-FHIR authentication (OAuth2) and authorization (Ref. <http://hl7.org/fhir/smart-app-launch/toc.html> )

### **FHIR Endpoints**

Note: Production and Test Server endpoints are subject to change.

### **Production Endpoint**

- FHIR : <https://fhirserver.astronautehr.com:9443/fhir-server/api/v4/>
- Authentication Server: <https://authserver.astronautehr.com/>

### **Test Server Endpoint**

- FHIR : <https://fhirserver.astronautehr.com:9443/fhir-server/api/v4/>
- Authentication Server: <https://authserver.astronautehr.com/>

### **Types of Smart-On-FHIR applications**

- Standalone App : SMART on FHIR confidential client with a patient context, refresh token, and OpenID Connect (OIDC) identity token.
- EHR Embedded app: Demonstrate the ability to perform an EHR launch to a SMART on FHIR
- Smart Backend Services App (Multi-patient authorization and API) : These are server-to-server backend applications e.g. Export clinical data for multiple patients in a group. This app is system level app without any UI.

### **Types of Authentications supported**

- Symmetric ("client secret") authentication ([HL7.FHIR.UV.SMART-APP-LAUNCH\Example App Launch for Symmetric Client Auth - FHIR v4.0.1](#))
- Asymmetric ("private key JWT") authentication ([HL7.FHIR.UV.SMART-APP-LAUNCH\Example App Launch for Asymmetric Client Auth - FHIR v4.0.1](#))
- Public Clients ([HL7.FHIR.UV.SMART-APP-LAUNCH\Example App Launch for Public Client - FHIR v4.0.1](#))

### **Steps for Smart App Launch**

1. Client App Registration
2. Retrieve .well-known/SMART-configuration
3. Obtain authorization code
4. Obtain access token
5. Access FHIR API
6. Refresh Token to obtain new access token

### **Client APP Registration**

Before a SMART app can run against an EHR, the app must be registered with that EHR's authorization service. We are using OAuth 2.0 Client Registration.

### **Client App Request process**

- Third-party application must sign the *API Subscription Agreement* with following details
  - The app name
  - The necessary APIs / Scopes
  - Any redirect URLs
  - Launch\_URL (optional)

- URL to JWK Set (Only for apps supporting asymmetric client authentication).
- The application is created by the EHR admin after confirming the app's registration parameters and communicates a client\_id to the app.
  - FHIR APIs (of any supported version) listed within the USCDI v1 core data set will be supported
  - Only reads data from FHIR server

## Retrieve .well-known/smart-configuration

In order to obtain launch context and request authorization to access FHIR resources, the app discovers the EHR FHIR server's SMART configuration metadata, including OAuth authorization\_endpoint and token\_endpoint URLs.

FHIR server makes SMART configuration available from well-known endpoint. You can get Authorization end point and token endpoint.

### Request

GET 200 <https://fhirserver.astronautehr.com/r4/.well-known/smart-configuration>

### Error codes

## Obtain authorization code

The app supplies the following parameters to the EHR's "authorize" endpoint.

### Parameters

---

<code>response_type</code>	<code>required</code>	Fixed value: <code>code</code> .
<code>e</code>		

---

## Parameters

client_id	required	The client's identifier.
redirect_uri	required	Must match one of the client's pre-registered redirect URIs.
launch	conditional	When using the EHR Launch flow, this must match the launch value received from the EHR. Omitted when using the Standalone Launch.
scope	required	Must describe the access that the app needs, including scopes like patient/*.rs, openid and fhirUser (if app needs authenticated patient identity) and either:  a launch value indicating that the app wants to receive already-established launch context details from the EHR a set of launch context requirements in the form launch/patient, which asks the EHR to establish context on your behalf.  Please refer to the scopes supported in the table below
state	required	An opaque value used by the client to maintain state between the request and callback. The authorization server includes this value when redirecting the user-agent back to the client. The parameter SHALL be used for preventing cross-site request forgery or session fixation attacks. The app SHALL use an unpredictable value for the state parameter with at least 122 bits of entropy (e.g., a properly configured random uuid is suitable).
aud	required	URL of the EHR resource server from which the app wishes to retrieve FHIR data. This parameter prevents leaking a genuine bearer token to a counterfeit resource server. (Note that in the case of an EHR launch flow, this aud value is the same as the launch's iss value.) Note that the aud parameter is semantically equivalent to the resource parameter defined in RFC8707. SMART's aud parameter predates RFC8707 and we have decided not to rename it for reasons of backwards compatibility. We might consider renaming SMART's aud parameter in the future if implementer feedback indicates that alignment would be valuable. For the current release, servers SHALL support the aud parameter and MAY support a resource parameter as a synonym for aud.

## Scopes Supported

Scope	Grants
patient/*.read	Permission to read and search any resource for the current patient (see notes on wildcard scopes below).
user/*.read	Permission to read and write all resources that the current user can access (see notes on wildcard scopes below).
openid	Permission to retrieve information about the current logged-in user.
launch	Permission to obtain launch context when app is launched from an EHR.
launch/patient	When launching outside the EHR, ask for a patient to be selected at launch time.
offline_access	Request a refresh_token that can be used to obtain a new access token to replace an expired one, even after the end-user no longer is online after the access token expires.

Here's an example of an authorization request using HTTP GET. You will replace the [redirect\_uri], [client\_id], [launch\_token], [state], [code\_challenge], and [audience] placeholders with your own values.

```

## Response

The EHR's authorization server reviews the request from your application. If approved, the authorization server redirects the browser to the redirect URL supplied in the initial request and appends the following querystring parameter.

- **code:** This parameter contains the authorization code generated by EHR, which will be exchanged for the access token in the next step.
- **state:** The exact value received from the client.

Here is how redirect URL will look like

Location: <https://app/after-auth?code=123abc&state=98wrghuwoogerg97>

```
https://inferno.healthit.gov/inferno/oauth2/static/redirect?code=SAMPLE\_CODE.bGF1bmN0L3BhdGlibnQgb3BlbmlkIGZoaXIVc2VylG9mZmxpbmVYWNiZXNzIHbhdkGlibnQvTWVkaWNhdGlibi5yZWFKlHBhdGlibnQvQWxsZXJneUludG9sZXJhbmlNlLnJlYWQgcGF0aVVudC9DYXJIUGxhbi5yZWFkiHBhdGlibnQvQ2FyZVRlYWOucmVhZCBwYXRpZW50L0NvbmrpdGlibi5yZWFKlHBhdGlibnQvRGV2aWNlLnJlYWQgcGF0aVVudC9EaWFnbm9zdGljUmVwb3J0LnJlYWQgcGF0aVVudC9Eb2N1bVVudFJZmVyZW5jZS5yZWFKlHBhdGlibnOvRW5jb3VudGVyLnJlYWQgcGF0aVVudC9Hb2FsLnJlYWQgcGF0aVVudC9jbW11bmj6YXRpb24ucmVhZCBwYXRpZW50L0xyY2F0aW9uUmVxdWVzdC5yZWFKlHBhdGlibnQvT2JzZXJ2YXRpb24ucmVhZCBwYXRpZW50L09yZ2FuaXphdGlibi5yZWFKlHBhdGlibnQvUGF0aVVudC5yZWFKlHBhdGlibnQvUHJhY3RpGJvbmvVlNjYWQgcGF0aVVudC9Qcm9jZWR1cmUucmVhZCBwYXRpZW50L1Byb3ZlbnFuY2UucmVhZCBwYXRpZW50L1ByYWN0aXRpb25IclJvbGUucmVhZCA=\_ODU=&state=26a45e37-7445-4e4a-b8fb-24144eccbd4
```

After receiving the authorization code, your application trades the code for a JSON object containing an access token and contextual information by sending an HTTP POST to the token endpoint using a Content-Type header with value of "application/x-www-form-urlencoded".

## Error codes

JSON response is returned from the FHIR Server along with the code

200: Ok

401: Unauthorized

400: Bad Request

500: Internal Server Error

## Obtain access token

For **public apps**, authentication not required because a client with no secret cannot prove its identity when it issues a call. (The end-to-end system can still be secure because the client comes from a known, https protected endpoint specified and enforced by the redirect uri.)

For **confidential apps**, authentication is required. Confidential clients SHOULD use [Asymmetric Authentication](#) if available, and MAY use [Symmetric Authentication](#).

There are two different requests to get access token based on authentication type. In case of Symmetric ("client secret") authentication app issues an HTTP POST to the EHR authorization server's token endpoint URL using content-type application/x-www-form-urlencoded.  
In case of Asymmetric authentication app, generate a client authentication assertion and prepare arguments for POST to token API:

### Request

Parameters		
grant_type	required	Fixed value: <b>authorization_code</b> for symmetric and <b>client_credentials</b> for assymetric
Code	required	Code that the app received from the authorization server
redirect_uri	required	The same redirect_uri used in the initial authorization request
client_id	conditional	Required for <b>public apps</b> . Omit for <b>confidential apps</b> .
client_assertion_type	conditional	Required for asymmetric authentication. set to urn:ietf:params:oauth:client-assertion-type:jwt-bearer
client_assertion	conditional	Required for asymmetric authentication. set to a JWT signed with your dynamic client's private key
Scope	conditional	system/*.read for backend services type of application (bulk operations)

token_type	required	Fixed value: <b>Bearer</b>
expires_in	recommended	Lifetime in seconds of the access token, after which the token SHALL NOT be accepted by the resource server
scope	required	Scope of access authorized. Note that this can be different from the scopes requested by the app.
id_token	optional	Authenticated user identity and user details, if requested
refresh_token	optional	Token that can be used to obtain a new access token, using the same or a subset of the original authorization grants

<b>Error Handling</b>	
<b>Error</b>	<b>Description</b>

404 - Not Found	The requested resource doesn't exist.
5xx - Server Error	Something went wrong on FHIR Server side.

[OperationOutcome](#) explains the error reported

## Profile audience and scope

This profile is intended to be used by developers of apps that need to access user identity information or other FHIR resources by requesting authorization from OAuth 2.0 compliant authorization servers.

The profile defines a method through which an app requests authorization to access a FHIR resource, and then uses that authorization to retrieve the resource. Synchronization of patient context is not addressed; for use cases that require context synchronization (e.g., learning about when the in-context patient changes within an EHR session) In other words, if the patient chart is changed during the session, the application will not inherently be updated.

## Security and Privacy Considerations

### App Protection

The app is responsible for protecting itself from potential misbehaving or malicious values passed to its redirect URL (e.g., values injected with executable code, such as SQL) and for protecting authorization codes, access tokens, and refresh tokens from unauthorized access and use. The app developer must be aware of potential threats, such as malicious apps running on the same platform, counterfeit authorization servers, and counterfeit resource servers, and implement countermeasures to help protect both the app itself and any sensitive information it may hold. For background, see the [OAuth 2.0 Threat Model and Security Considerations](#).

Specific requirements are:

- Apps SHALL ensure that sensitive information (authentication secrets, authorization codes, tokens) is transmitted ONLY to authenticated servers, over TLS-secured channels.
- Apps SHALL generate an unpredictable **state** parameter for each user session; SHALL include **state** with all authorization requests; and SHALL validate the **state** value for any request sent to its redirect URL.
- An app SHALL NOT execute untrusted user-supplied inputs as code.
- App SHALL NOT forward values passed back to its redirect URL to any other arbitrary or user-provided URL (a practice known as an “open redirector”).
- An app SHALL NOT store bearer tokens in cookies that are transmitted as clear text.
- Apps SHOULD persist tokens and other sensitive data in app-specific storage locations only, and SHOULD NOT persist them in system-wide-discoverable locations.
